

1           1.    A display comprising:  
2                a display panel including a first display element  
3 on said panel; and  
4                a layer mounted on said panel including a central  
5 more transparent portion and a peripheral less transparent  
6 portion.

1           2.    The display of claim 1 including a pair of  
2 abutting display panels, including a gap between said  
3 panels, an obscuring region situated over said gap.

1           3.    The display of claim 2 wherein said layer is an  
2 integral piece including transparent and non-transparent  
3 regions, said non-transparent regions situated over said  
4 gap.

1           4.    The display of claim 3 wherein said transparent  
2 and non-transparent regions are formed integrally in said  
3 layer.

1           5.    The display of claim 4 wherein the sides of said  
2 non-transparent regions are made reflective.

1           6.    The display of claim 5 wherein said non-  
2 transparent region is relatively rectangular.

1           7.    The display of claim 5 wherein said non-  
2 transparent region is triangular.

1           8.    The display of claim 5 wherein said non-  
2 transparent region is arranged to avoid obscuring emitted  
3 light from said element.

1           9.    The display of claim 2 wherein said layer  
2 includes a lens element formed therein.

1           10.   The display of claim 9 wherein a lens element is  
2 situated over each of said panels.

1           11.   The display of claim 10 including a shield  
2 situated over said interface.

1           12.   The display of claim 11 including a lens having  
2 an internal surface which reflects light.

1           13.   The display of claim 1 wherein said shield has  
2 openings formed therein to obscure said interface.

1           14.   The display of claim 13 wherein said openings are  
2 filled with a black material.

1           15. The display of claim 13 wherein said openings  
2 have light reflective coatings thereon.

1           16. A method comprising:  
2           abutting first and second display tiles at an  
3 interface; and  
4           providing a layer in said first and second tiles  
5 to obscure said interface.

1           17. The method of claim 16 including securing the  
2 layer over said first and second display tiles to obscure  
3 said interface.

1           18. The method of claim 17 including applying a plate  
2 to a display panel to form said tiles, said plate having  
3 substantially transparent and substantially non-transparent  
4 regions formed therein, and situating said non-transparent  
5 regions over said interface.

1           19. The method of claim 18 including forming said  
2 non-transparent regions integrally in said plate with said  
3 transparent regions.

1           20. The method of claim 19 including forming  
2 reflective surfaces on the sides of said non-transparent  
3 regions.

1           21. The method of claim 16 including forming a plate  
2 over said first and second tiles, and forming a rectangular  
3 non-transparent region in said plate to obscure said  
4 interface.

1           22. The method of claim 16 including forming a plate  
2 over said first and second tiles including a triangular  
3 region formed therein, and situating said triangular region  
4 over said interface.

1           23. The method of claim 16 including forming a lens  
2 over each of said tiles.

1           24. The method of claim 23 including forming a shield  
2 between said lenses and over said interface.

1           25. A display comprising:  
2               a sheet including upper and lower sides;  
3               a plurality of light emitting elements positioned  
4 on said lower side; and  
5               a plurality of slots formed in the lower side of  
6 said sheet between adjacent light emitting elements.

1           26. The display of claim 25 wherein said slots are  
2 coated to make them reflective.

1           27. The display of claim 25 including conductors  
2 extending through said slots to contact said light emitting  
3 elements.

1           28. The display of claim 25 where said slots are  
2 filled with a black material.

1           29. The display of claim 25 wherein the indices of  
2 reflection between the material in said slots and said  
3 plate are sufficiently different to cause reflections to  
4 occur along the surface of said slots.

1           30. The display of claim 25 wherein said slots are  
2 Vee shaped.
